

Mandatory assignment 2

Introduction

You have been given the assignment to create a Windows service. You must choose one service to create from the options below.

Your service must be written in PowerShell.

The service should have complete functionality, with options for starting and stopping by changing the example on its Learning.

The service should start a Scheduled Task for at least 1 action it is performing.

The service should be logging relevant details about its operations to a specified logging directory.

You can make a custom config-file for you service, but this is not required.

Options

1. **Simple backup/sync script:**

Periodically copies files from a source folder to a backup folder.

Only copies changed files.

Simple: compare timestamps or sizes

Advanced: compare file hashes

Logs number of files copied, skipped, and any errors.

2. **“Paranoid Canary File” Tamper Detector:**

A background service that watches a special “canary file” in the user’s folder. If the file is modified, deleted, or copied elsewhere, the service logs the event and silently restores the original file from a backup.

3. **Custom:**

Pitch your idea and I might accept it!

Requirements

- **Robustness:**
Your service must be able to recover from a crash.
- **Logging:**
Your service should output relevant logging details with timestamps, in case of a crash, restart, startup, or warnings during runtime.
- **Programming language:**
Your service must be written in PowerShell.

Deliverables

- A .zip file containing:
 - o The source code for your service
 - o A script and/or readme.txt detailing installation
 - o Any extra config files necessary
 - o An example logfile from the output of your service
- A short report and summary about what your service does and how it works, preferably with some screenshots. **Maximum 5 pages.**
